

Human Heart - Overview

The human heart is a vital organ responsible for pumping blood throughout the body. It is a muscular organ located slightly to the left side of the chest. The heart works continuously to supply oxygen and nutrients to tissues and remove carbon dioxide and other wastes. The heart consists of four chambers: - Two upper chambers called atria - Two lower chambers called ventricles Blood flow process: Deoxygenated blood enters the right atrium, moves to the right ventricle, and is pumped to the lungs. After receiving oxygen, it returns to the left atrium, moves to the left ventricle, and is pumped to the entire body. Key functions: - Maintains blood circulation - Supplies oxygen and nutrients - Removes waste products A healthy heart is essential for overall well-being. Regular exercise, a balanced diet, and avoiding harmful habits like smoking help maintain heart health.
